

# ANNOUNCING ☺

## Radio Works R.F. Consulting Now Brings

## Thermal Infrared Testing

Imagine the possibilities of seeing heat and potential fire hazards in your physical plant.

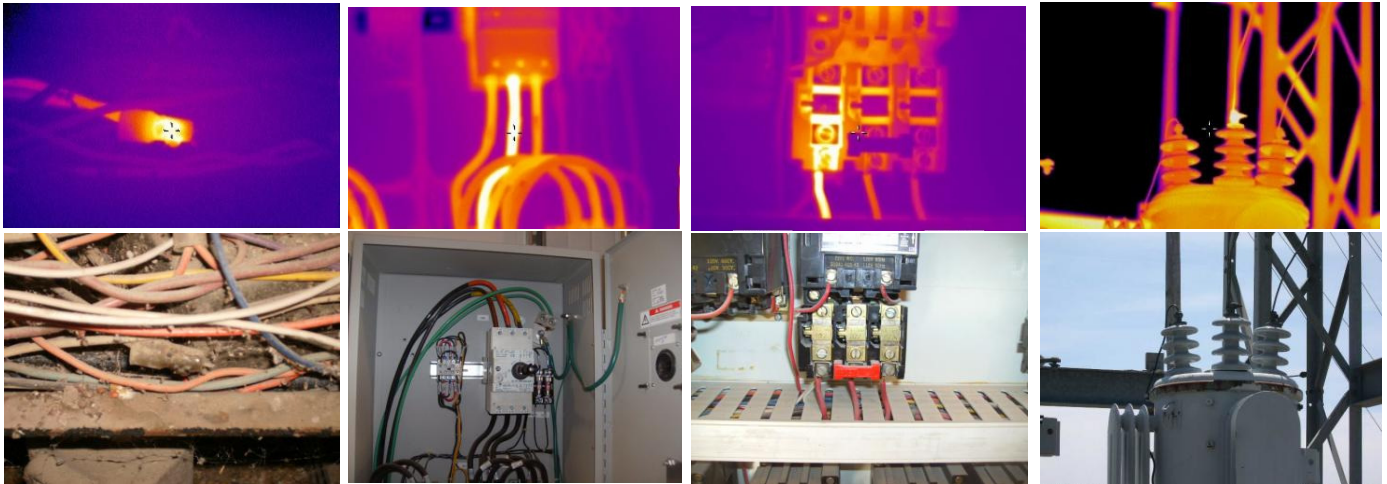

Thermal imagers convert infrared radiation into electrical signals and renders the energy as visible colors.

Radio Works R.F. Consulting can now perform completely contact-free testing on materials, machines and electrical systems with the Testo 881 thermal imager. This system allows you to visualize problems in industrial maintenance and plant monitoring before a malfunction or a fire risk occurs. For the R.F. related industries and Broadcasters, transmission line analysis is now possible from the ground without going off the air. Baseline heat

signatures can be taken for future reference with our telephoto lens system. With the Testo 881, you are on the trail of energy loss and heat related hazards through whole building Thermography. Our Testing will help you to save expensive electrical energy costs and premature failure of electrical systems from primary building services mains to individual machines and electronics. With the new Testo 881 thermal imager, we can save you time, energy and money.

Fire is inspirational,, Let it inspire you to test your physical plant today
